

Increase Proportion of Durable Wood Products

- Seek to harvest wood that could produce long-lived products
- Even better if used instead of other high GHG materials

Benefits

- Avoids emissions and increases the forest sector carbon stock
- If products are used for longer than the equal amount of wood growth occurs, HWP carbon pool can add to forest sector carbon storage
- Additional benefits if substitute for higher emissions products
- Can be paired with previous strategies to increase carbon

Considerations

- Not possible in all stands
- Difficult to quantify outcomes across forest products supply chain
- May or may not be included in carbon payment programs/markets

May be possible to accumulate benefits higher than on-site carbon, but a lot of unknowns
