

# ↑ Reduce Emissions from Forest Supply Chain

- Many ways we can reduce GHG emissions from other parts of the forest supply chain (biofuels, electricity, better efficiency, promote better recycling/reuse of wood products)
- To reduce GHG concentrations in the atmosphere we need to *reduce* fossil-based emissions, as well as sequester and store

## Benefits

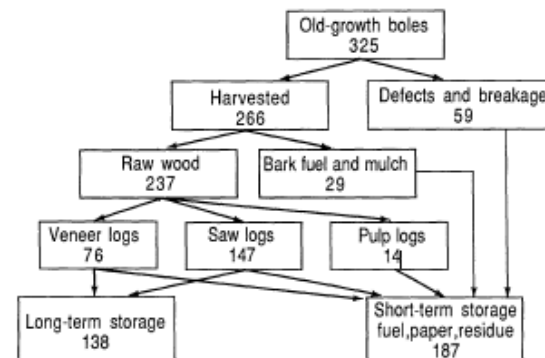

- Seek to avoid GHG emissions which are the main driver of climate change
- Can help the forest supply chain be better positioned in the future

## Considerations

- Any emissions reductions in transportation, fuel use, etc. are not included in forest carbon markets/programs yet
- Will require incentives to help folks transition
- Lower emissions technology isn't available for all forestry needs

Are there ways to improve the efficiency of harvests?
